FAQ: The MB-Ruler loupe does not show the area of the current cursor position

This can happen, if the screen scale is not set to 100% for better readability.

Normally MB-Ruler calculates the values for correct display automatically.
In rare reasons, it fails.

This way you will solve this issue:
Additional to the help files, these files are part of the ZIP archive:

- ScaledScreenScreenShotMethod0.reg
- ScaledScreenScreenShotMethod1.reg
- ScaledScreenScreenShotMethod2.reg
- ScaledScreenScreenShotMethod3.reg

Follow this step by step instruction for each of the REG files, until the content of the screen loupe is correct.

1. Close MB-Ruler, if active
2. Double click ScaledScreenScreenShotMethod<0-3>.reg
   A value will be written to the registry. Depending on your system, administrator rights are necessary.
3. Start MB-Ruler
4. Check the loupe function
5. Continue with the next REG file, if the content of the loupe is not correct

Please inform me by email (MB-Ruler@Markus-Bader.de), which setting solved the issue on your device. Thank you.
